

crypttab

This configuration allows us to automatically unlock but not mount external drives. For example:

```
/etc/crypttab
diskn          UUID=<path to disk by /dev/disk/by-uuid>    /etc/keyfiles/<keyfile name>
luks,nofail
```

This configuration will use the keyfile `/etc/keyfiles/keyfile` to `/dev/disk/by-uuid/id` and create a device node for that disk at `/dev/mapper/diskn` for mounting in `fstab`.

Do not directly mount the disk
